- 1. First, we show that S is closed and bounded. There exists  $D(2,2) \subseteq S \implies S$  is bounded. And for  $x \in \mathbb{Q} \setminus S$ , if  $x \leq \sqrt{2}$ ,  $D(x,d(x,\sqrt{2})) \subseteq \mathbb{Q} \setminus S$ . If  $x \geq \pi$ ,  $D(x,\pi) \subseteq \mathbb{Q} \setminus S \implies \mathbb{Q} \setminus S$  is open. Then, S is closed.
  - $G_i = (\sqrt{2} \frac{1}{n}, \pi \frac{1}{n}) \cap \mathbb{Q}$ , then  $\bigcup_{i=1}^{\infty} G_i$  is an open cover of S but doesn't have finite subcover. Thus, S is not compact.
- 2. Assume  $\bigcap_{n=1}^{\infty} V_n = \emptyset$ .

And since 
$$\operatorname{int}(V_n) \subseteq V_n \subseteq \operatorname{cl}(V_n) \subseteq V_{n-1}, V_n \subseteq V_{n-1}$$
. Then,  $\bigcap_{n=1}^k V_n = V_k$ . Since  $\operatorname{cl}(V_n)$  is compact,

- 3. Since  $x, y \in K$ , then assume there doesn't exists a set in G s.t. it contains both of x, y, then G doesn't contain one of x, y or both neither. Thus, G doesn't cover K, contradict to G is a open cover. Thus, there exists a set in G containing both x, y.
- 4. Since A is totally bounded, for all  $\varepsilon > 0$ , exists  $\{x_i\}_{i=1}^N$  is a finite set s.t.  $A \subseteq \bigcup_{i=1}^N D(x_i, \varepsilon)$ . And M is complete  $\implies$  every Cauchy sequence in M converge to a point in M.

Then, for any sequence  $\{y_i\}$  in  $\operatorname{cl}(A)$ , if there is not any subsequence converge to  $\operatorname{cl}(A)$ , there exists  $\varepsilon' > 0$  s.t.  $|y_m - y_n| > \varepsilon'$  for all  $m, n > N \in \mathbb{N}$ .  $\cup D(y_i, \varepsilon')$  will be a infinite open cover of A, which contradicts to there has a finite N s.t.  $\cup D(x_i, \varepsilon')$  is cover of A.

Thus, every sequence in cl(A) have subsequence converge to a point in  $cl(A) \implies cl(A)$  is sequence compact. Then, by BWT, cl(A) is compact.
